

2+6 WAY POWER-DATA BATTERY INTERFACES

CONNECTION BETWEEN BATTERY, MOTOR, AND CHARGER

For data communication and power transmission between the battery, motor, and charger, we developed our Power-Data Battery Interface Family. The system is designed primarily for applications below 42 volts.

With this application, you have the advantage that the power supply between the battery and the motor, as well as the connection to the charger, is established with only one interface.

When the battery is inserted, the interface connects the battery to the motor. In this state, the battery can be charged directly through the built-in interface in the frame. When the battery is removed, the built-in socket in the battery can be connected to the charging cable, allowing the battery to be charged in any location the rider desires.

The interfaces are suitable for various versions of swing-in in-tube batteries and non-swing-in frame batteries. Our patented, sophisticated connecting system convinces through an extremely compact design and a large number of mating cycles. Reliable data and power transmission even under extreme conditions such as wetness, vibrations, or shocks is a matter of course.

Various pole numbers are possible, as well as harnesses that can be individualized and adapted to the customer's needs.

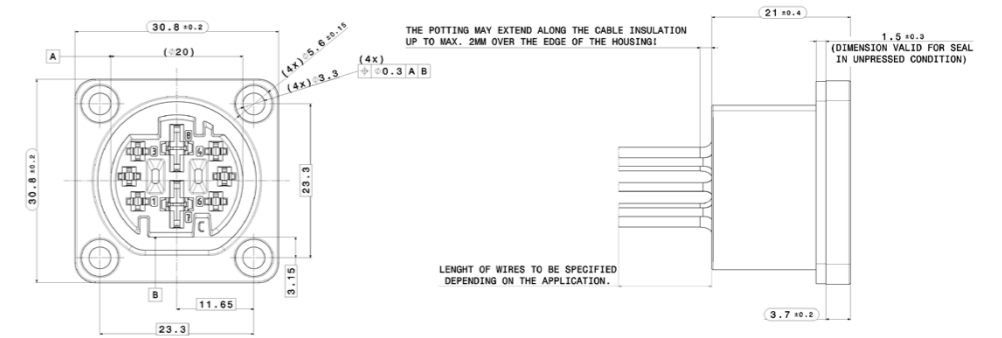

In close cooperation with our customers, we realize product requirements for optimal system integration.
